Project Demo Planning

Wandr AI – AI Travel Itinerary Planner

1. Demo Objectives

- Demonstrate the complete end-to-end user journey from landing page to itinerary generation.
- Show the AI generation, day regeneration, and budget tracking as the three core differentiators.
- Demonstrate the security posture (JWT auth, CORS protection, RLS).
- Verify the health check endpoint confirms all services are live.

2. Demo Script – 10 Minute Slot

Time	Activity	Who
0:00–1:00	Open health check URL, confirm all flags true	Presenter
1:00–2:00	Open frontend, explain landing page value prop	Presenter
2:00–3:30	Live signup or login with prepared account	Presenter
3:30–6:00	Fill New Trip form (Tokyo, 5 days, cultural), generate	Presenter
6:00–7:30	Browse itinerary, open Budget tab, show chart	Presenter
7:30–8:30	Regenerate Day 3, show only that day changes	Presenter
8:30–9:30	Open /api/docs, show Swagger, call /api/health	Presenter
9:30–10:00	Q&A; – show test results (34 tests) if asked	All

3. Demo Prerequisites

- Render backend is awake (hit health check 2 minutes before demo).
- Test account pre-registered in Supabase (bypass email confirmation in demo env).
- Browser has no cached session (open incognito for clean signup demo).
- GROQ_API_KEY, SUPABASE_URL, and all Render env vars confirmed set.

4. Fallback Plan

If the Render backend is in cold-start during the demo, present the health check output from a recent successful run and explain the cold-start behaviour of free-tier services. The Swagger documentation at /docs does not require a warm server and can be shown statically.
